

ABSTRACT OF THE DISCLOSURE

The optical scan module comprises a light emission source, a deflection unit, a light emission source drive circuit, a deflection unit drive circuit, a fixing unit by concurrent use of terminals, etc. are integrally fixed to a holder. The optical scan module is constituted as a single integral solid body with a function for deflecting a light beam from the light emission source by the deflection unit to repeat scanning. Furthermore, the optical module is mounted on a substrate to constitute an optical scanner, which is used for constitution of an image generator and an image reader.
